

ResumeIQ

Resume screening built on real retrieval and real language-model reasoning — every score, match, and answer traces back to the candidate's actual words.

THE REASON

Hiring doesn't scale by reading faster.

A single open role can draw hundreds of resumes. Reading each one closely, scoring it fairly, and remembering how it compared to the last fifty candidates is slow and inconsistent — not because recruiters lack skill, but because no one can hold hundreds of resumes in their head at once, and a great candidate can get buried in the pile.

ResumeIQ exists to make that process fast, consistent, and genuinely intelligent — not just automated. Every score is a real language-model judgment on the actual resume text. Every search and match is a real mathematical comparison, not a keyword guess.

The design rule this product is held to: if you removed the underlying AI and ML entirely, it should stop working — not just get worse.

FEATURE 01

Bulk Resume Screener

Score and rank an entire stack of resumes against one job role, in a single pass.

- 1 Drop in any number of resumes (PDF or Word) along with the target role.
- 2 Each file's text is extracted — including scanned resumes, using built-in OCR.
- 3 Every resume is independently scored against the role: matched skills, missing skills, and a written justification.
- 4 Results are automatically ranked best-to-worst and saved as a session you can revisit anytime.

WHY IT MATTERS

Turns an hour of manual reading into one upload — with a defensible, ranked shortlist waiting at the end of it.

FEATURE 02

Cross-Resume Search

Ask a plain-English question across every resume ever screened — not just the current batch.

- 1 Every screened resume is converted into a numerical "fingerprint" of its meaning.
- 2 Your question is converted into that same kind of fingerprint.
- 3 The system mathematically finds the closest-matching resumes across every past session.
- 4 Only those matching resumes are shown to the AI, which writes a direct answer naming the specific candidates.

WHY IT MATTERS

Recruiters can search an entire candidate history in seconds, in their own words — instead of reopening dozens of old resumes one by one.

FEATURE 03

Find Similar Candidates

Pick one strong candidate, and instantly surface others with a genuinely similar profile.

- 1 Select any previously screened candidate.
- 2 Their own fingerprint becomes the search query — no retyping needed.
- 3 Every other candidate is ranked by real mathematical closeness to that profile.
- 4 An optional AI-written explanation describes why two candidates are alike, generated only on request.

WHY IT MATTERS

When your first choice isn't available, find their closest match in one click — not by guessing which keywords to search for.

FEATURE 04

Interview Prep Generator

A tailored interview guide for any role, experience level, and skill set — generated in seconds.

- 1 Enter a designation, an experience level, and optionally, key skills.
- 2 The system generates five technical and three behavioral questions suited to that exact profile.
- 3 Each question comes with recommended talking points to guide the conversation.
- 4 The full guide can be copied and used directly in an interview.

WHY IT MATTERS

Gives hiring managers a structured, role-specific interview guide without writing one from scratch every time.

FEATURE 05

PDF ⇌ Word Converter

Convert documents between PDF and Word, in either direction, without leaving the tool.

- 1 Upload a PDF or Word file.
- 2 A dedicated document engine performs a high-fidelity conversion when available.
- 3 If that engine isn't available, a built-in fallback converter still produces a usable result.
- 4 The converted file downloads immediately, and every conversion is logged for later reference.

WHY IT MATTERS

Resumes and offer letters constantly need to change format — this removes the extra software and copy-pasting.

VERIFIED, NOT ASSUMED

Two tests we hold this product to

Anyone can claim a product is "AI-powered." Here's how this one proves it.

If the AI service is ever unreachable, the product fails honestly with a clear error message — it never quietly substitutes a fake or guessed answer.

Find Similar Candidates' ranking works correctly even with AI switched off entirely — because that ranking is pure mathematical similarity. Proof that this one feature never needed AI to begin with, and that everywhere else in the product, it genuinely does.

BUILT WITH

Stack

Next.js 16

App Router, full-stack framework

Local embedding model

Meaning fingerprints, no API call

Document engine + fallback

PDF ⇌ Word conversion

Groq

Language model inference

Tesseract OCR

Reads scanned resumes locally

Cloud-synced storage

Works locally and on serverless hosting

CLOSING THOUGHT

**Every score, every match, every answer —
backed by real analysis, not guesswork.**
